

Omega Machine & Tool has come out with a steel washer/spacer to repair the 48RE rear extension housings. The snap ring wears into the case allowing the geartrain to move back and forth. This ring saves the housing by positioning the rear bearing where it belongs.

There are two thicknesses available for different amounts of wear. The 120363 is by far the most often used. The thinner size is part # 120364
